

Crypto Acceleration on FreeBSD

Philip Paeps
philip@FreeBSD.org

The FreeBSD Project

meetBSD 2008 — Mountain View, CA, USA
16 November 2008

Outline

- 1 Cryptography in FreeBSD**
 - Userland Applications
 - Kernel Subsystems
 - Drawbacks and Problems
- 2 The opencrypto Framework**
 - History and Purpose
 - Kernel and Userland Interface
 - Hardware Acceleration
 - Use in Applications
- 3 Performance Measurements**
 - glxsb(4) on a Soekris
 - hifn(4) on a Fast AMD64
- 4 Future Directions**

Outline

- 1 Cryptography in FreeBSD**
 - Userland Applications
 - Kernel Subsystems
 - Drawbacks and Problems
- 2 The `opencrypto` Framework**
 - History and Purpose
 - Kernel and Userland Interface
 - Hardware Acceleration
 - Use in Applications
- 3 Performance Measurements**
 - `glxsb(4)` on a Soekris
 - `hifn(4)` on a Fast AMD64
- 4 Future Directions**

Userland Applications

- OpenSSL in the base system
- GnuTLS and others in ports
- Homegrown implementations

Kernel Subsystems

- IPSEC
- Block Devices
 - GBDE
 - GELI
- ZFS

Drawbacks and Problems

- Many CPU-intensive operations
- Limited parallelism
- Lots of scary code-duplication

Outline

- 1 Cryptography in FreeBSD**
 - Userland Applications
 - Kernel Subsystems
 - Drawbacks and Problems
- 2 The opencrypto Framework**
 - History and Purpose
 - Kernel and Userland Interface
 - Hardware Acceleration
 - Use in Applications
- 3 Performance Measurements**
 - glxsb(4) on a Soekris
 - hifn(4) on a Fast AMD64
- 4 Future Directions**

History and Purpose

- Ported from OpenBSD in 2002
- Consistent software and hardware interface
- Originally particularly intended for IPSEC
- Fairly modular and extendable design

Kernel and Userland Interface

- Asynchronous session-oriented interface
- Kernel systems use `<openssl/cryptodev.h>`
- Userland uses `ioctl` interface on `/dev/crypto`

Hardware Acceleration

- Device drivers register callbacks with framework
- Support one or more algorithms
- Limited support for flow-control
- Caveat: acceleration can sometimes slow things down!

Supported Devices

- `glxsb(4)` — AMD Geode
- `hifn(4)` — Hifn
- `padlock(4)` — VIA Padlock
- `safe(4)` — SafeNet
- `ubsec(4)` — Broadcom/Bluesteel

Use in Applications

- Most kernel subsystems use crypto(9)
 - ... Notable exception: GBDE
- OpenSSL cryptodev ENGINE
 - Not used automatically
 - Fairly easy to use
 - Work in progress (patches)

Outline

- 1 Cryptography in FreeBSD**
 - Userland Applications
 - Kernel Subsystems
 - Drawbacks and Problems
- 2 The opencrypto Framework**
 - History and Purpose
 - Kernel and Userland Interface
 - Hardware Acceleration
 - Use in Applications
- 3 Performance Measurements**
 - glxsb(4) on a Soekris
 - hifn(4) on a Fast AMD64
- 4 Future Directions**

Simple openssl speed Test

```
% openssl speed -evp aes-128-cbc
```

```
[...]
```

```
The 'numbers' are in 1000s of bytes per second processed.
```

type	16 bytes	64 bytes	256 bytes	1024 bytes	8192 bytes
aes-128-cbc	4936.66k	5476.96k	5648.11k	5693.51k	5701.87k

```
% openssl speed -evp aes-128-cbc -engine cryptodev
```

```
engine "cryptodev" set.
```

```
The 'numbers' are in 1000s of bytes per second processed.
```

```
[...]
```

type	16 bytes	64 bytes	256 bytes	1024 bytes	8192 bytes
aes-128-cbc	5850.39k	23944.46k	118509.23k	416638.93k	3879235.74k

Encrypting a Large File

```
% dd if=/dev/random of=cryptme bs=1M count=350

% /usr/bin/time -h openssl enc -e -aes-128-cbc [...]
1m11.57s real 1m7.69s user 3.34s sys

% /usr/bin/time -h openssl enc -e -aes-128-cbc [...] -engine cryptodev
18.41s real 1.51s user 16.75s sys
```

Simple openssl speed Test

```
% openssl speed -evp aes-128-cbc
```

```
[...]
```

```
The 'numbers' are in 1000s of bytes per second processed.
```

type	16 bytes	64 bytes	256 bytes	1024 bytes	8192 bytes
aes-128-cbc	50014.57k	55329.90k	57058.55k	57505.75k	57578.37k

```
% openssl speed -evp aes-128-cbc -engine cryptodev
```

```
engine "cryptodev" set.
```

```
The 'numbers' are in 1000s of bytes per second processed.
```

```
[...]
```

type	16 bytes	64 bytes	256 bytes	1024 bytes	8192 bytes
aes-128-cbc	367.92k	1525.02k	5146.43k	11861.38k	20413.72k

Encrypting a Large File

```
% dd if=/dev/random of=cryptme bs=1M count=350

% /usr/bin/time -h openssl enc -e -aes-128-cbc [...]
8.47s real    7.44s user    1.01s sys

% /usr/bin/time -h openssl enc -e -aes-128-cbc [...] -engine cryptodev
21.33s real    0.34s user    2.82s sys
```

Outline

- 1 Cryptography in FreeBSD**
 - Userland Applications
 - Kernel Subsystems
 - Drawbacks and Problems
- 2 The opencrypto Framework**
 - History and Purpose
 - Kernel and Userland Interface
 - Hardware Acceleration
 - Use in Applications
- 3 Performance Measurements**
 - glxsb(4) on a Soekris
 - hifn(4) on a Fast AMD64
- 4 Future Directions**

Future Directions

- Reduce code-duplication in acceleration drivers
- Enable cryptodev ENGINE by default in OpenSSL
